GLP-1

WHAT IS GLP-1?

Your body's own fat-burning hormone

GLP-1 (Glucagon-Like Peptide-1) is a hormone produced naturally in your gut. It is the same biological mechanism that Ozempic and Wegovy artificially activate — but your body was always designed to make it on its own.

SIGNALS FULLNESS

Tells your brain to stop eating — naturally

BURNS FAT

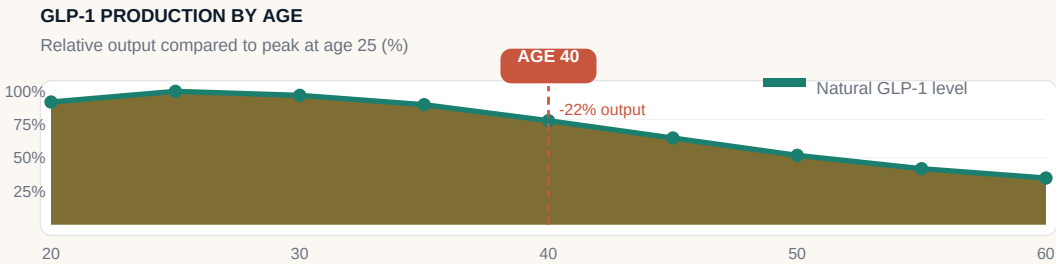

Promotes stored fat as fuel over muscle

CONTROLS BLOOD SUGAR

Regulates insulin without medication

KILLS CRAVINGS

Reduces hunger between meals significantly

Follow @hormoneandher for the full 21-day reset protocol

WHY YOURS STOPPED WORKING

6 things silently killing your GLP-1

After 40, these everyday habits suppress your natural GLP-1 production — and most women have no idea.

- 01

CHRONIC STRESS

Cortisol directly suppresses GLP-1 release pathways. Stressed women store 35% more belly fat.
- 02

POOR SLEEP

Even one night under 7 hours measurably reduces GLP-1 output the next day.
- 03

ARTIFICIAL SWEETENERS

Diet sodas, sugar-free products — they blunt gut L-cell sensitivity and maintain cravings.
- 04

SKIPPING BREAKFAST

Cortisol peaks on waking. Not eating keeps it elevated — 4 hours of belly fat storage.
- 05

ULTRA-PROCESSED FOOD

Damages the gut microbiome. GLP-1-producing L-cells require healthy gut bacteria to function.
- 06

REFINED VEGETABLE OILS

Sunflower, canola, corn oil — pro-inflammatory and directly suppress GLP-1 response.

Remove these 6 blockers and GLP-1 begins to recover within days.

HOW TO REACTIVATE IT

5 natural GLP-1 activators

Stack these every day for 21 days. The hormonal effect compounds — each week stronger than the last.

- PROTEIN AT BREAKFAST**

+40–60% GLP-1 boost

30g within 60 mins of waking. Eggs, Greek yoghurt, smoked salmon. The single highest GLP-1 trigger of the day.
- SOLUBLE FIBRE**

+25–35% sustained release

Oats, lentils, flaxseed, apples. Feed the gut bacteria that produce GLP-1 in your intestinal wall.
- FERMENTED FOODS**

Builds L-cell density over time

Kefir, live yoghurt, kimchi, sauerkraut. One serving daily restores the microbiome that powers GLP-1.
- 10-MIN POST-MEAL WALK**

Extends GLP-1 satiety window

Walking after eating reduces blood sugar by 30% and keeps GLP-1 elevated longer after meals.
- APPLE CIDER VINEGAR**

-34% post-meal glucose spike

1 tbsp in 200ml water before your two largest meals. Primes the gut for a stronger GLP-1 response.
